Pionier- oder Ruderalstandorte

○ = sonnig ● = halbschattig ● = schattig

Pionier- oder Ruderalflächen zeichnen sich durch eine ausgeprägte Dynamik aus. Sie finden sich auf kargen Böden (Kies, Sand), aber auch auf nährstoffreicherem, lehmigen. Pionierflächen entstehen nach einem massiven Eingriff: wenn Humus abrutscht oder abgetragen wird; wenn ständig gejätet wird; wenn ein Baum gefällt wird und plötzlich Licht im Übermass vorhanden ist; auf Dächern, in Trockenmauern, entlang von Strassen und Wegen, auf Kies- und Schuttplätzen.
